MEUResÍDUO

Através dessa pesquisa obtivemos um panorama de como está gestão de resíduos em cada estado brasileiro.

Os dados foram retirados da plataforma do Sistema Nacional de Informações sobre Saneamento (SNIS) e são referentes aos anos de 2018, 2019, 2020 E 2021.

QUANTIDADE DE RESÍDUOS MANEJADOS POR ESTADO

- VISÃO POR TIPO DE TECNOLOGIA -

Dados podem não ter sido informados pelos estados ou apenas estarem zerados.

LIXÕES

Ainda presente em cidades pequenas ou regiões pobres do país, o lixão é a pior maneira de disposição final do lixo.

Trata-se de um grande depósito a céu aberto, sem qualquer planejamento, controle ou medida de proteção ao meio ambiente ou à saúde pública. Também não há fiscalização do estado nem do município.

UNIDADES DE TRIAGEM

Uma unidade de triagem de resíduos é uma instalação projetada para receber, separar e processar os resíduos provenientes de diversas fontes, como domicílios, comércios e indústrias.

O objetivo principal é realizar a separação dos materiais recicláveis dos não recicláveis, direcionando-os para os respectivos destinos adequados.

ATERROS SANITÁRIOS

Esta é a melhor opção técnica atualmente para a disposição ambientalmente adequada de resíduos sólidos urbanos (RSU), que oferece riscos mínimos para o meio ambiente e à saúde pública, se bem operada.

No aterro sanitário, o lixo é depositado em locais que foram preparados para isso. O solo é nivelado e impermeabilizado, os resíduos são recobertos com terra, há um sistema de drenagem e tratamento para o chorume e os gases liberados, como o metano.

ATERROS CONTROLADOS

Teoricamente, esta é uma forma intermediária entre o aterro sanitário e o lixão, com algumas melhorias em lixões antigos.

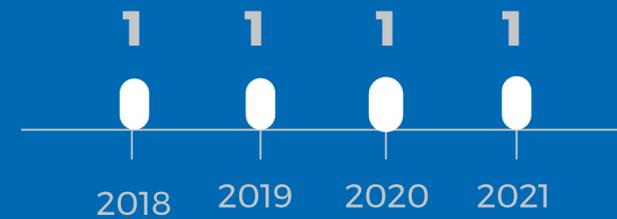

São lugares onde o lixo é disposto de forma controlada e os resíduos recebem uma cobertura de solos.

No entanto, os aterros controlados não recebem impermeabilização do solo nem sistema de dispersão de gases e de tratamento do chorume gerado.
